Automated Feedback Analysis Workflow

Brandon Robinson

Introduction

- This project showcases an automated customer feedback analysis system for a small e-commerce business. Customer feedback is collected via Google Forms, analyzed using AI to determine sentiment and generate summaries, and stored in Google Sheets for visibility and tracking. The workflow is automated in Make, with email alerts triggered for negative feedback to support timely customer response.

Google Forms

Make automation processes feedback with **Gemini AI**, classifies sentiment, and triggers alerts

Form_Responses					
Timestamp	How satisfied are you with our product or service?	Please describe your experience or share any feedback in your own words.	Sentiment	Summary	Alert Sent?
12/25/2025 14:16:06	Unsatisfied	The product arrived later than expected and the setup instructions were unclear. It works n	Negative	to form a complete opinion. The product's late arrival and unclear setup instructions caused a frustrating experience, even though it is now functional.	Yes
12/25/2025 14:16:32	Satisfied	The product works well and does what I expected. The mouse is comfortable, although the	Positive	The user is satisfied that the product works well and meets expectations, appreciating the comfortable mouse despite the keyboard keys feeling a little stiff.	
12/25/2025 14:16:32	Very unsatisfied	I had issues with my order and never received a response from customer support. I would n	Negative	The customer is very unsatisfied due to issues with their order and a lack of response from customer support, causing them to not recommend the product.	Yes
12/25/2025 14:17:52	Very satisfied	*Excellent wireless keyboard and mouse. The connection is stable, the keys are comfortabl	Positive	The user is very satisfied with the excellent wireless keyboard and mouse, highlighting its stable connection, comfortable keys, and responsive mouse.	

Results are stored in **Google Sheets** for tracking, reporting, and team visibility.

Customers submit feedback via **Google Forms**

Results

Key Results

- 6 total feedback submissions processed
- Sentiment distribution:
 - Positive: 2
 - Neutral: 2
 - Negative: 2
- All submissions were automatically analyzed and stored without manual intervention
- Negative entries triggered alerts as designed

Sample Sentiment Summaries

Positive:

- "The product works well and does what I expected..."

Neutral:

- "The bundle works as described, but nothing really stands out."

Negative:

- "The product arrived later than expected and the setup instructions were unclear."

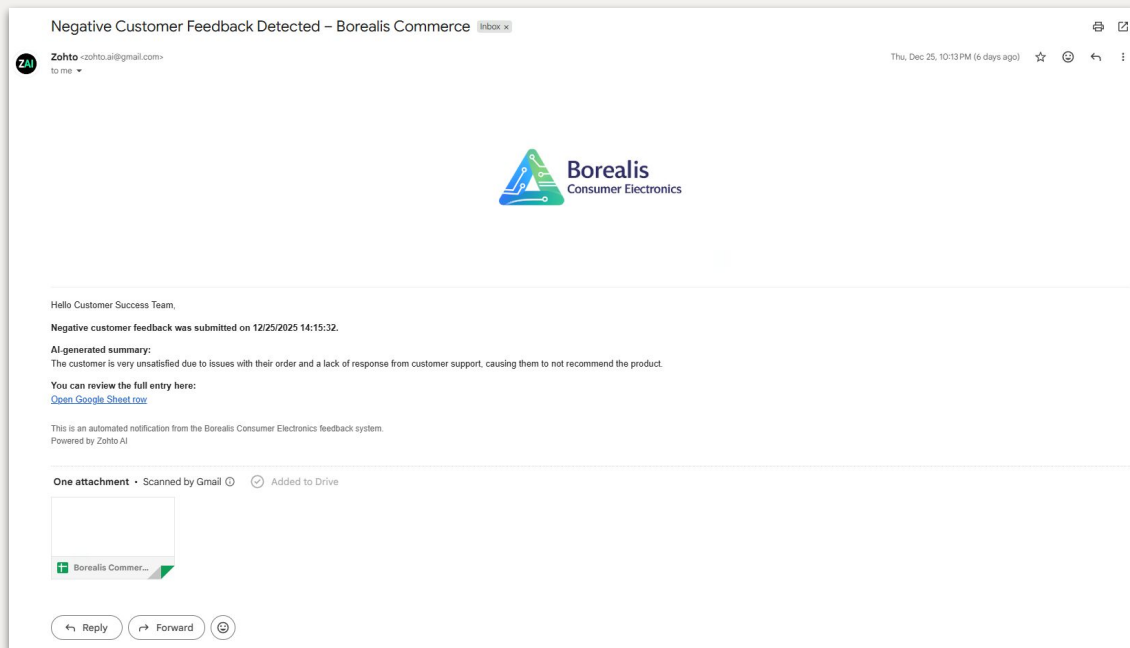

Key Insights

- The product meets basic needs but lacks standout features.
- The user is satisfied with product performance despite minor comfort issues.
- Late delivery and unclear setup instructions caused frustration.
- Customer dissatisfaction is driven by unresolved support issues.

Optional extras

Automated Negative Feedback Alerts

- In addition to storing analyzed feedback in Google Sheets, the workflow includes an automated email alert that triggers when negative sentiment is detected.
- This allows the Customer Success team to respond quickly to high-risk feedback without manually monitoring submissions.

Challenges & improvements

What worked well

- The end-to-end automation reliably processed all submissions without manual intervention.
- Structured JSON output from Gemini made sentiment parsing consistent and easy to store.
- Automated alerts ensured negative feedback was surfaced immediately to the Customer Success team.

What I'd improve with more time or tools

- Add confidence scoring to sentiment classifications for better prioritization.
- Expand alert routing (e.g., Slack or ticketing system integration).
- Build a lightweight dashboard to visualize trends over time instead of relying solely on Sheets.

Next Steps

1

Expand Signal Quality

Refine sentiment analysis by adding confidence scores and keyword tagging to better prioritize high-risk feedback and reduce false positives.

2

Improve Alert Routing

Route negative feedback to Slack or a ticketing system (e.g., Zendesk) so issues automatically enter existing Customer Success workflows.

3

Add Trend Visibility

Build a lightweight dashboard (Looker Studio or Sheets charts) to track sentiment trends over time and surface recurring issues.
